Transportation system in Mumbai

Public Transport

Railways:

• Primary mode of public transport in Mumbai
• Total sub-urban rail route network in MMR - 400 km
• Total 100 sub-urban stations
Transportation system in Mumbai

Public Transport

Bus:

- Brihanmumbai Electric Supply and Transport Undertaking (BEST) is the largest public bus transport service provider
- BEST operates services within Greater Mumbai, and to major destinations outside Greater Mumbai
- Total number of buses in service (2013-2014): 4,288  
  Non-AC buses: 3,799 (80% of the total fleet);  
  AC buses: 412
  Total buses on CNG - 2,985 (63.5% of the total fleet)

- These buses mostly non-air conditioned, operate on over 365 routes covering a distance of over 7 lakh kilometres daily, carrying over 38 lakh passengers on daily basis.

- Private buses also play a major role in intercity movement. Pickup and drop-off points by private buses are informally organised.
Transportation system in Mumbai

Public Transport

Metro rail:

- Metro proposed for a total length of 146 km with nine corridors.
- Phase I, Versova – Ghatkopar (10.8 kms) shall reduce journey time from 90 minutes to 21 minutes.

- Navi Mumbai metro will have six corridors of length 108.75 km.
Transportation system in Mumbai

Monorail

- Envisaged as a feeder network to mass transit system
- Implementation of about 20km stretch from Sant Gadge Maharaj Chowk (Jacob circle)-Wadala - Chembur with 18 stations as pilot project is under operation.

State of road transport in Mumbai
Traffic Congestion

- Traffic congestion results from the desire of the people to live and work closely and thus derive a gain in productivity.

- Congestion is said to exist if the speeds are significantly reduced and the driving cycle is marked by frequent stops and go which reduce efficiency and hence level of service, resulting in more consumption of fuel and more travel time.

- Traffic congestion reasons include rise in number of vehicles, high population densities, road incidents, breakdown of vehicles, road parking etc.

- Traffic congestion leads to not only economic losses due to lost time as well as an increase in greenhouse gases and vehicular air pollution.
Objective of the Study

• To analyse the greenhouse gas emissions for road transport sector in Mumbai Metropolitan Region (MMR).

• To measure average speeds on selected arterial road lengths subject to congestion in the city of Mumbai and investigate the effects of congestion on the corresponding greenhouse gas emissions.

Goal of the study is to estimate the share of greenhouse gas emissions from the road transport sector that can be attributed to traffic congestion.
Methodology

1) Estimate the greenhouse gas emissions from the road transport sector in MMR using the vehicle kilometre based method.

2) Estimate the greenhouse gas emissions from the road transport sector in MMR using the fuel consumption based method.

3) Conducting congestion survey on four major roads in MMR to arrive at the congestion index (travel time index)
Methodology

Vehicle kilometre travelled based method

1) Estimate the vehicle population data for the year 2014 in MMR using the historical trend.

2) Estimate the total vehicle kilometre travelled in MMR for 2014 by multiplying the vehicle population with average trip length obtained from the Comprehensive Transport Study Report for MMR.

3) Estimating the greenhouse gas emissions by multiplying the total vehicle kilometre travelled with the vehicle category-wise emissions factors (gm/km)

4) Vehicle category-wise emissions factors obtained from the report published by the Automotive Research Association of India.

GHG = Vehicle population x Average annual trip length (km) x emission factor (gm/km)
Methodology

**Vehicle kilometre travelled based method**

Methodology

*Fuel consumption based method*

1) Estimating the greenhouse gas emissions by multiplying the fuel consumed in MMR with the emissions factors (kg/GJ) obtained from the IPCC report.

\[
\text{GHG} = \text{Fuel consumed (GJ)} \times \text{fuel emission factor (kg/GJ)}
\]
Methodology

Congestion survey on four major roads in Mumbai

1) Four major roads of Mumbai carrying significant traffic load through MMR and experiencing frequent visible traffic congestion and jams were selected for the study.

2) Preliminary survey was first carried on the road to be surveyed, to identify the section of the road, length of the road and the points of origin and destination.

3) Origin and destination points were kept as bus stops to allow for exact time and distance measurement.

4) The time of survey for the roads was chosen so as to coincide with their peak and off-peak time flow which was identified based on the traffic count data from the TRANSFORM 2008 report.
Methodology

Congestion survey on four major roads in Mumbai

5) Journey by auto rickshaw or bus in both the directions was undertaken successively so as to ascertain the direction of peak flow in that duration.

6) Total of eight trips were undertaken for each road.

7) The peak hour data was collected on working days while the off-peak data was collected on weekends.

8) The travel time index was calculated as the ratio of peak to off-peak time taken to travel the given section of the road.

\[
\text{Travel Time Index} = \frac{\text{Travel time on a specific road section during peak hours}}{\text{Travel time on a specific road section during off-peak hours}}
\]
## Methodology

</table>
Conclusion

• CO₂ emissions in the Mumbai Metropolitan Region for the year 2014 was found to be 19,065 tonnes per day using fuel consumption based method and 12,445 tonnes per day using the VKT method.

• The CO₂ emissions from the fuel consumption method for MMR are approximately 53% more than the VKT method.

• Average travel time index (TTI) for the four roads was found to be 1.51.

• This signifies that vehicles in MMR take approximately 51% more time to complete the trip under congested conditions as compared to free flow conditions.
Conclusion

• Thus, it may be implied that TTI provides a reasonable good indication of the approximate share of CO$_2$ emissions from the transport sector due to congestion.

• The relationship obtained in this study between congestion and increase in greenhouse gas emissions may be of significance to the policy makers and urban planners to roughly arrive at an estimate of the contribution of congestion to the increase in GHG emissions.
